Implement Client Script & UI Policy (Incident) – FSD Documentation

1. Introduction

• Project Title: Implement Client Script & UI Policy (Incident)

• Platform: ServiceNow

• Table: Incident [incident]

2. Project Overview

• Purpose: improve the Incident form with conditional client-side behavior.

• Features: custom Client Scripts, UI Policies, UI Policy Actions, validation, visibility, mandatory and read-only control.

3. Configuration Architecture

• Client Scripts use client-side APIs such as GlideForm.

• UI Policies evaluate conditions and apply UI Policy Actions.

• Client Scripts and UI Policies should be designed together to avoid conflicting behavior.

4. Configuration Steps

• Create Client Scripts for required onLoad/onChange/onSubmit behavior.

• Create UI Policies on Incident and define conditions.

• Configure UI Policy Actions for mandatory, visible, or read-only behavior.

• Test each rule in a non-production instance.

5. Testing

• Create and update Incident records.

• Test condition true and false paths.

• Verify messages and field states.

• Check for conflicts between Client Scripts and UI Policies.

6. Demo / Screenshots

• Insert screenshots of the configured Incident form and related configuration records.
