Implement Client Script & UI Policy (Incident) – Final Project Report

1. INTRODUCTION

• Project Title: Implement Client Script & UI Policy (Incident)

• Project Overview: ServiceNow Incident form customization using Client Scripts and UI Policies.

2. IDEATION PHASE

• Problem: Incident forms can allow incomplete or inconsistent user input when conditional guidance is not configured.

• Solution idea: use client-side rules to guide users dynamically while they create or update Incident records.

3. REQUIREMENT ANALYSIS

• Customer journey: open Incident → enter details → conditional guidance appears → validate/update → submit.

• Solution requirement: configure Incident Client Scripts and UI Policies with clear conditions and test cases.

• Technology Stack: ServiceNow platform, Incident table, GlideForm client API, Client Scripts, UI Policies and UI Policy Actions.

4. PROJECT DESIGN

• Problem-Solution Fit: client-side form rules directly address dynamic validation and field-attribute requirements.

• Proposed Solution: combine Client Scripts for custom logic with UI Policies for straightforward field state changes.

• Solution Architecture: Incident form → Client Scripts/UI Policies → dynamic user experience.

5. PROJECT PLANNING & SCHEDULING

• Define requirements → configure Client Scripts → configure UI Policies → test true/false conditions → user acceptance testing → document and deploy.

6. FUNCTIONAL AND PERFORMANCE TESTING

• Validate onLoad, onChange and onSubmit behaviors where applicable; verify UI Policy actions and check for conflicting rules.

7. RESULTS

• Expected output: an Incident form that provides appropriate validation and conditional field behavior. Add final screenshots to this section.

8. ADVANTAGES & DISADVANTAGES

• Advantages: improved usability, immediate feedback, fewer incomplete forms, maintainable configuration.

• Consideration: client-side behavior alone should not be relied on for server-side data enforcement.

9. CONCLUSION

• The project provides a structured ServiceNow solution for improving the Incident form with Client Scripts and UI Policies.

10. FUTURE SCOPE

• Add more business rules, server-side enforcement where needed, automated regression testing, and deployment automation.
